

## MacGregor Park Hamilton County, Indiana

Owner: Washington Township, Hamilton County  
Contact: Mr. David Gill

Client: Flaughter Inc.  
Contact: Mr. Steve Meier

Year: 2008  
Project: MacGregor Park Native Landscaping  
Project Type: Installation

Williams Creek Management understands that landscaping with native plants greatly improves the environment. Not only is native landscaping good for the environment, it saves time and money. Once established, native plants no longer need pesticides, fertilizers, or watering because they are adapted to the local conditions. A native landscape does not need to be mowed like a conventional lawn, reducing the demand for non-renewable resources and improving the water and air quality.

Williams Creek Management provides a wide-variety of turnkey biological wastewater treatment system construction and installation services. Both biological and structural systems can be used to effectively manage wastewater issues. Biological treatment systems can be great alternatives to conventional onsite wastewater treatment systems, providing an ideal financially responsible and environmentally conscious solution to wastewater treatment.

Williams Creek Management provided natural resource services to install native landscape and wetland treatment cell plugs at MacGregor Park in Hamilton County, Indiana. Services provided include:

- Installation of 4.94 acres of native prairie seed mix
- Installation 940 bioswale plugs
- Installation 400 wetland treatment cell plugs
- Installation of 5.28 acres of straw mulch
