MANAGEMENT

POWER & ENERGY

Controlling Impacts, Providing Access & Protecting Assets

Working closely with industry leading power and energy providers, we ensure natural resource and water quality requirements of a project are identified, mitigated, and managed. Our team constructs and installs the systems needed to control unintended impacts to our environmental resources. We manage the project from beginning to end by implementing and maintaining the needed sediment controls and access solutions, followed by site restoration and removal of all temporary controls and solutions.

The implementation and maintenance of these environmental impact controls allows a power generation and distribution project to move forward without interruption and with confidence all natural resource regulatory requirements are in compliance. Our clients can leave a completed project knowing we have self-performed all the services needed to restore a disturbed area back to its natural condition.

Working with our clients, we have the ability to create a stronger, healthier, more vibrant environment. By controlling impacts, providing access, and protecting assets, we ensure regulatory compliance so their project can have the planned lasting impact.
